

# Know before you trust.

AI decision intelligence for everyday life, work, and digital trust

## PROJECT SNAPSHOT

15K+ analysis and problem-solving interactions • 5K+ CV and resume templates • community leaderboard • contributor reputation • CRX ecosystem rewards

Investor & Ecosystem Whitepaper | October 2026

Prepared from current Crexto product materials and project information supplied for investor and ecosystem communications.

# 1. Executive Summary

Crexto AI is a decision-intelligence platform designed for the moments when information is abundant but clarity is limited. It helps users understand what they are about to buy, trust, sign, submit, or act on by routing each problem through a specialized AI workflow.

Rather than treating every request like a generic chat, Crexto uses domain-specific agents with dedicated inputs, reasoning frameworks, report formats, follow-up questions, and next-step recommendations.

The current platform spans six core intelligence surfaces: Authenticity, Value, Trust, Document, Career, and Web3. Career adds a reusable CV/template network, while the community layer turns useful participation into visible reputation and contributor rankings.

| Metric                              | Current project figure |
|-------------------------------------|------------------------|
| Analysis / problem-solving activity | 15K+ interactions      |
| CV / resume template library        | 5K+ templates          |
| Seed funding                        | \$1.5M                 |
| Seed valuation                      | \$10M                  |
| Stated TGE FDV                      | \$100M                 |

**Core thesis**

Crexto is building the intelligence layer between information and action: collect the right evidence, analyze it through the right lens, expose uncertainty, and help the user decide what to do next.

## 2. The Problem: Information Without Decision Context

People increasingly make important decisions from fragmented digital evidence: marketplace listings, screenshots, websites, product specifications, certificates, contracts, job descriptions, career materials, and Web3 project information.

- Buying decisions require context beyond price: condition, specifications, claims, evidence, and missing information.
- Trust decisions often depend on signals spread across websites, offers, messages, and marketing claims.
- Long documents contain obligations, deadlines, renewal terms, payment structures, and clauses that are easy to overlook.
- Job seekers need more than writing assistance; they need a clearer picture of role alignment, missing evidence, and application quality.
- Web3 information can be technically dense even when the underlying information is publicly available.

Generic chat systems can answer questions, but the user still has to structure the evidence, ask the right follow-up questions, and decide which parts of the response matter. Crexto turns that open-ended interaction into a repeatable decision workflow.

## 3. The Solution: Specialized AI Decision Workflows

Crexto starts with the user's decision rather than the model. The platform identifies the domain, collects the evidence that matters for that domain, and returns a structured intelligence report.

### Core workflow

- Bring the information: upload a file, paste text, share a link, add screenshots, or describe the situation.
- Choose the agent: select the workflow that matches the decision.
- AI analyzes: extract facts, evaluate signals, identify risk or value factors, and surface missing information.
- Understand the report: review the assessment, confidence, evidence, concerns, and recommendations.
- Take action: ask follow-up questions, revise the input, compare options, or move forward with the user's own judgment.

### Product principles

- Core AI use remains accessible without external asset or account requirements beyond the platform account features.
- AI outputs separate facts, user-provided claims, estimates, inferences, and unknowns.
- Private files remain private by default.
- When evidence is insufficient, the product should say so rather than force a confident answer.
- Community systems reward useful contribution instead of empty activity.

## 4. Six Specialized Intelligence Agents

### Authenticity Agent

Is it real? Assesses products, documents, certificates, listings, images, and evidence for suspicious signals, inconsistencies, unsupported claims, and missing verification.

### Value Agent

Is it worth it? Evaluates an asking price using supplied product details, condition, specifications, included items, available context, and comparable information when provided.

### Trust Agent

Can I trust it? Analyzes sellers, websites, offers, projects, and propositions for credibility signals, risk indicators, inconsistencies, and pressure tactics.

### Document Agent

What am I agreeing to? Breaks down contracts, terms, invoices, agreements, rental documents, NDAs, and other complex text into obligations, dates, money, renewal, termination, and key concerns.

### Career Agent

How strong is my profile? Analyzes CVs, resumes, cover letters, professional profiles, and job descriptions for strengths, evidence gaps, ATS compatibility, and role alignment.

### Web3 Agent

What is this information telling me? Explains Web3 project materials, token and protocol information, transaction descriptions, and other user-supplied Web3 data in accessible language without requiring external asset connections.

# 5. Intelligence Reports

Crexto is designed around structured intelligence rather than generic summaries. The report format makes uncertainty visible and gives the user a concrete next step.

| Metric                  | Current project figure                                                                                                                 |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Common report sections  | Assessment • Confidence • Evidence • Positive signals • Concerns • Missing information • Recommended actions • Questions • Limitations |
| Agent-specific sections | Price position • clauses • ATS alignment • trust signals • authenticity signals • Web3 risk context                                    |

## Responsible output design

- Distinguish observable facts from model inference.
- Label estimates as estimates.
- Never invent jobs, degrees, certificates, market prices, or achievements.
- Use insufficient evidence when the input cannot support a strong conclusion.
- Keep legal, financial, authenticity, and security language within informational limits.

## 6. Career Intelligence & CV Template Network

Career is a first-class product surface inside Crexto. The goal is to connect AI-powered career analysis with a reusable resource layer where people can discover and contribute CV and resume templates.

### Career Studio

- CV Analyzer: identify strengths, missing evidence, ATS issues, and improvement priorities.
- CV Builder: create and refine professional resumes using structured information supplied by the user.
- Job Match: compare a CV with a job description and identify alignment and evidence gaps.
- Cover Letter: generate role-specific drafts grounded in the user's actual experience.
- Professional Profile: organize a consistent career narrative across documents and applications.
- CV Template Library: browse, upload, publish, and reuse professional templates.

#### Current template network

Crexto currently has approximately 5K+ CV and resume templates across professional, student, technical, academic, and creative formats.

## 7. Community, Reputation & Contributor Economy

Crexto becomes more valuable as users contribute useful resources and public knowledge. The community layer turns those contributions into visible reputation and discoverability.

- Public leaderboard for top contributors.
- Public contributor profiles with reputation history and published work.
- Community CV templates and career resources.
- Public AI analyses and reusable knowledge where the creator chooses to publish.
- Campaigns that recognize high-value contributors with CRX ecosystem rewards.

### Contributor loop

**Create → Publish → Help → Build Reputation → Earn Ecosystem Rewards**

A contributor can move from a useful template or analysis to a stronger public profile and greater participation in Crexto campaigns.

# 8. Current Product Traction

The current product snapshot points to two compounding resources: analysis activity and reusable career content. These figures are current project figures supplied for Crexto communications.

| Metric                                  | Current project figure                           |
|-----------------------------------------|--------------------------------------------------|
| Problem-solving / analysis interactions | 15K+                                             |
| CV / resume templates                   | 5K+                                              |
| Core intelligence agents                | 6                                                |
| Community layer                         | Leaderboard + reputation + contributor campaigns |

The strategic value of these resources is cumulative. Every completed analysis improves the product's understanding of recurring decision patterns, while every useful template increases the utility of the Career surface and gives new contributors a reason to participate.

## 9. Funding & Strategic Backing

Crexto has been presented with the following funding and ecosystem profile for current investor materials.

| Metric         | Current project figure |
|----------------|------------------------|
| Seed funding   | \$1.5M                 |
| Seed valuation | \$10M                  |
| Stated TGE FDV | \$100M                 |

### Backed by / strategic participation

- KuCoin
- Zealy
- Vantec Angel Network
- Mantella Venture Partners
- Inovia Capital
- Backed VC
- Skyland Ventures
- B Strategy
- Additional valued partners

Funding, valuation, backing, and strategic participation figures in this document are based on project-provided information for current materials. Individual investment agreements and amounts by participant are not itemized here.

## 10. Business Model

Crexto is designed to monetize decision intelligence and career utility rather than rely on speculative token activity.

- Premium AI: higher usage, advanced workflows, personalization, saved intelligence, and deeper career features.
- Career products: advanced CV tooling, job matching, professional profile features, and creator utilities.
- Template ecosystem: premium template experiences and creator-side tools.
- B2B and team plans: shared workflows, organization features, controls, and collaborative intelligence.
- Community campaigns: branded or ecosystem-sponsored contributor programs built around useful resources.
- Partnerships: distribution and integration opportunities with platforms serving hiring, commerce, education, and digital ecosystems.

The model is deliberately multi-layered so Crexto can increase monetization without making basic product access dependent on token ownership.

# 11. CRX Ecosystem

CRX is positioned as the participation and reward layer around the Crexto community. Its role is to connect contribution, reputation, creator activity, and campaign participation inside the product.

- Contributor rewards tied to useful platform activity.
- Campaign-based incentives for high-value community work.
- Creator participation around CV templates and other resources.
- Longer-term ecosystem utilities as the product and community mature.

## Project milestone

The project materials state a TGE fully diluted valuation (FDV) of \$100M. This figure is presented as a project milestone and not as a statement of current market liquidity or guaranteed value.

This whitepaper intentionally does not specify token distribution quantities, token supply schedules, current market price, exchange liquidity, or guaranteed returns.

# 12. Roadmap

## Phase 1 - Intelligence Foundation

Refine the six agent workflows, specialized prompts, report schemas, file handling, follow-up intelligence, and reliability safeguards.

## Phase 2 - Community Layer

Scale public profiles, reputation, leaderboard mechanics, contribution publishing, and community moderation.

## Phase 3 - Career Network

Expand the template library, creator tools, job matching, professional profiles, and career personalization.

## Phase 4 - Monetization

Introduce premium intelligence, career products, team plans, creator tooling, and structured ecosystem campaigns.

## Phase 5 - Ecosystem Scale

Expand agent coverage, discovery, integrations, community knowledge, and CRX utility as the network grows.

# 13. Positioning & Differentiation

Crexto is designed around the decision a user is trying to make, not the novelty of a chatbot interface.

| Layer          | Generic AI Chat           | Crexto AI                                   |
|----------------|---------------------------|---------------------------------------------|
| Workflow       | Broad conversation        | Agent-specific decision workflow            |
| Evidence       | User organizes context    | Inputs structured for the decision          |
| Output         | General answer or summary | Structured intelligence report              |
| Career utility | Separate tools            | Integrated Career Studio + template network |
| Community      | Usually limited           | Reputation + public contribution layer      |
| Participation  | Consumption focused       | Contribution and campaign focused           |

## 14. Trust, Safety & Conclusion

Crexto is strongest when it is explicit about uncertainty. The system should help a user see what is known, what is inferred, what is estimated, and what remains unresolved.

- Authenticity analysis is not forensic certification.
- Document analysis is informational and not legal advice.
- Value assessments depend on the quality and freshness of supplied market context.
- Career tools must not invent work history, credentials, or achievements.
- Web3 analysis should explain user-provided information without pretending to independently verify facts that were not supplied.

### Conclusion

Crexto AI is building the intelligence layer between information and action. Its opportunity is to make everyday decision-making more structured, more transparent, and more useful by combining specialized AI workflows with a growing career resource network and a contributor-driven community.
